

INFORMATION INTEGRATION SYSTEM**ABSTRACT**

5 A method and implementing computer system are provided for enabling a display of selective context-sensitive input-related field information concerning selected fields within a displayed information input form. In one exemplary embodiment, a field in which a cursor is placed, is enlarged
10 relative to the remainder of the form to facilitate input to the selected field while maintaining an overall view of the remainder of the displayed form. Information is then input into the enlarged window and upon movement of the cursor to a different field, the enlarged view of the previous field
15 is returned to normal size within the displayed form with the information input to the enlarged window being retained in the appropriate field within the form. In another embodiment, context or field-sensitive input format information and other required aspects of input information
20 are selectively displayed in windows which are selectively positioned relative to the current input field. In an exemplary embodiment, a user is enabled to use a selection screen function to pre-determine preferred options with regard to the placement of the field-sensitive format
25 information relative to the current input field.
